AB **Branched** copolymers of **polypropylene** (PP) and hydrogen siloxanes are prepared by procedures involving melt phase hydrosilylation. Such branched copolymers may be formed in situ during the melt phase hydrosilylation or may be prepared by subsequent processing. The branched copolymers exhibit superior elasticity over the original PP for use in spinning, thermoforming, blow molding, and foaming and are reactable with surfaces and polymers having OH groups, such as glass fibers.

AB **Branched polyolefins** in the form of a comb, star, nanogel, or structural combinations thereof are prepared by reacting polyolefin pre-arms with a polyhydrosilane in the presence of a hydrosilylation catalyst, in which the catalyst is dosed to the reaction mixture at an elevated temperature to promote the addition of Si-H groups across the

ethylenic unsatn. of the polyolefin pre-arm. The method of the invention can be carried out optionally in the presence of an accelerator to promote the hydrosilylation reaction.

AB A branched polymer in the form of a comb, star, nanogel, or any structural combination thereof comprises a plurality of polyolefin arms selected polymers of 1-alkenes or combinations thereof linked to a polymer backbone. Backbone having repeating units containing a group selected from aliphatic groups, aromatic groups, heteroatom containing groups, and combinations thereof and wherein the polyolefin arms have a polydispersity equal to or less than 1.8. In an example ethylene-**propylene copolymer** was subjected to the **hydrosilylation** reaction with polymethylhydrosiloxane to give a branched polymer of this invention. The polymers of this invention are useful as impact modifiers and additives to lubricant oils and fuels.

AB Polyolefin with high mol. weight in the form of a comb, star, nanogel or structural combinations thereof comprises a plurality of polyolefin arms each independently selected from the group consisting of homo- and copolymers of substituted and unsubstituted 1-alkenes linked to a polymer backbone, the backbone having repeating units containing a group selected from the group consisting of aliphatic groups, aromatic groups, heteroatom-containing groups and combinations thereof, in which the polyolefin polymer has a mol. weight (Mw) of at least 0.8×10^6 g/mol, the polyolefin arm has a mol. weight (Mw) of at least 5×10^3 g/mol. The ratio between the mol. weight (Mw) of the polyolefin polymer and the mol. pre-arm is 4-20. The polyolefin arms are typically prepared using metallocenes.
